

PASTA worksheet

Stages	Sneaker company
I. Define business and security objectives	Make 2-3 notes of specific business requirements that will be analyzed. • <i>The app processes financial transactions.</i> • <i>User accounts store personal and financial data, so privacy and secure authentication are core requirements</i> • <i>The app should be in compliance with PCI-DSS.</i>
II. Define the technical scope	List of technologies used by the application: • <i>Application programming interface (API)</i> • <i>Public key infrastructure (PKI)</i> • <i>SHA-256</i> • <i>SQL</i> APIs should be prioritized because they connect customers, sellers, and internal systems, exchanging sensitive data across multiple points. This creates a larger attack surface than a single encryption method. However, the specific APIs in use should be evaluated before assuming they're the biggest risk, since not all APIs are equally exposed.
III. Decompose application	Sample data flow diagram
IV. Threat analysis	List 2 types of threats in the PASTA worksheet that are risks to the information being handled by the application. • <i>SQL injection</i> • <i>Social engineering</i>
V. Vulnerability analysis	List 2 vulnerabilities in the PASTA worksheet that could be exploited. • <i>Lack of prepared statements</i> • <i>Weak or reused login credentials</i>
VI. Attack modeling	Sample attack tree diagram

VII. Risk analysis and impact	List 4 security controls that you've learned about that can reduce risk. Multi-factor authentication, Principle of least privilege, Prepared statements, Rate limiting.
