

Ticket ID	Alert Message	Severity	Details	Ticket status
A-2703	SERVER-MAIL Phishing attempt possible download of malware	Medium	The user may have opened a malicious email and opened attachments or clicked links.	Escalated ▾

Ticket comments
This alert was triggered after an employee received a phishing email disguised as a job applicant inquiry, which contained a password-protected attachment matching a file hash already confirmed malicious in a prior investigation. This alert should be escalated for the following reasons: the sender's email domain (.su) is inconsistent with the display name "Def Communications" and is a known high-risk top-level domain; the message contains grammatical errors ("writing for to express," "Egnieer" instead of "Engineer") typical of phishing attempts; and the attachment's file hash has already been verified as malicious malware (FlagPro/Fragtor Trojan) through VirusTotal analysis. Given the confirmed malicious hash and multiple phishing indicators, this incident warrants escalation to the next tier for containment and remediation.

Additional information

Known malicious file hash:
